Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

WELLY 95-262627/34.

Stimulating/inhibiting insulin release with exendin polypeptide(s) - Stimulating/inhibiting insulin release with exendin polypeptide(s) - for treating diabetes mellitus and preventing hyperglycaemia.

Claim 2, columns 13-14, 17pp; English.

RR0544 is the Heloderma suspectum exendin 4 residues 1-31, where the native Pro31 has been replaced with a Tyr residue. It is an insulinotropic peptide, and can therefore be used in the treatment of diabetes mellitus (types I or II), and for the prevention of hyperglycaemia. It normalises hyperglycaemia through glucose-dependent and insulin-(in)dependent mechanisms.
R80544 standard; peptide; 31 AA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 cating disorders and insulin resistance of the disperse.

cating disorders and insulin resistance claims 19, 26; page 11, 214pp; English.

The invention relates to an wethod for treating disorders that are alleviated by reducing food intake, in particular obesity, type II diabetes, eating disorders, insulin resistance syndrome, elevated plasma glucose levels, or the risk of cardiac disease. The method comprises administering an exendin or an exendin agonist. The treatment reduces appetite and lowers plasma lipid levels. It inhibits food consumption as effectively as amylin or cholecystokinin but has a much longer-lasting action (still effective after 6 hours in a mouse model). The present sequence is that of exendin-4 (1-30) or its amide which is one of the preferred compounds for use in the method.
Exendin; obesity; type II diabetes; eating disorders; cardiac disease; insulin resistance syndrome; elevated plasma glucose level; agonist.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

Reducing food intake by administering exendins or their

Reducing food intealment of e.g. obesity, type II diabetes,

analogues - for treatment of e.g. obesity, type II diabetes,

cating disorders and insulin resistance

Claims 17, 25, Page 8; 214pp; English.

The invention relates to a new method for treating disorders that

The invention relates to a new method for treating disorders that

I diabetes, eating disorders, insulin resistance syndrome, elevated

II diabetes, and indiagonal and invention and exendin agonist. The treatment

reduces appetite and lowers plasma lipid levels. If inhibits fod

consumption as effectively as amylin or choleestokinin but has a much

longer-lasting action (still effective after 6 hours in a meuse model).

The present sequence is that of exendin-4 which is one of the preferred

compounds for use in the method.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Claim 6; Columns 13-14; 17pp; English.
R80546 is Heloderma suspectum exendin-4. It is an distull notropic peptide, and can therefore be used in the treatment of diabetes mellitus (types I or II), and for the prevention of hyperglycaemia. It normalises hyperglycaemia through glucose-dependent sed insulin-(in)dependent mechanisms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               29-MAR-1999 (first entry)
Exendin-4, for use in treating disorders related to food intake.
Exendin; obesity; type II diabetes; eating disorders; cardiac disease; insulin resistance syndrome; elevated plasma glucose level; agonist.
                                                                                       27-FEB-1996 (first entry)
Heloderma suspectum exendin-4.
Exendin-4; diabetes mellitus; hyperglycaemia; insulinotropic peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

The modorine tumours, also to treat poisoning by reptile venom claim 3; Fig 2; 26pp; English.

The meloderma suspectum prockendin peptide is encoded by its cDNA which was isolated from a H. suspectum salivary gland cDNA library. The proexendin protein comprises of a novel exendin A peptide ENTY.

The proexendin protein comprises of a novel exendin N-terminal consensus dipeptidyl peptidase cleavage site. The proexendin conn. identify related sequences (e.g. the care of Heloderma horridum, mutant alleles and proexendin connected with metabolic disease) and species homologues (e.g. for developing animal models for drug screening). The proexendin peptide can be used to raise antibodies. Anti-proexendin can be used to raise antibodies. Anti-proexendin with altered levels of proexendin (e.g. endocrine tumours and organ failure), for identifying other regulators of cell metabolism, in drug screens and for treating metabolic diseases (e.g. diabetes) and for neutralising, or detecting, reptilian venom peptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Truncated versions of exendin peptide(s) for treating diabetes -
increase secretion and biosynthesis of insulin, but reduce those of
juccagon, and do not induce hypoglycaemia
glucagon, and do not induce hypoglycaemia
This peptide is a fragment of exendin-4 isolated from Heloderma
This peptide and its salts, esters and derivatives can be
used to treat diabetes mellitus. They stimulate biosynthesis and
secretion of insulin, but have the opposite effect on glucagon, and
independent of this activity can increase peripheral glucose utilisation.
Exendin-3 and exendin-4 are only active when blood sugar levels are
high, so they will not induce hypoglycaemia. Compared with glucagon-like
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      /note= "This residue can be any amino acid except Gly"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Welly NRA, Gedulin B, Prickett KS, Young AA;
WPI: 98-145351/13.
Regulating gastrointestinal motility using exendins or their
agonists - for treating spasm, diabetic postprandial hyperglycaemia,
impaired glucose tolerance etc., also in diagnostic investigations
Claims 20 and 21; Fig 1; 70pp; English.
WA7749 describes a generic exendin agonist, provided that it does
have the formula of either exendin-3 (W47608) or exendin-4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Exendin agonists, which reduce gastric motility and delay gastric emptying, can be used to treat spasm (where associated with acute diverticulitis or disorders of the biliary tract or sphincer of Oddi), postprandial dumping syndrome and hyperglycaemia (particularly associated with type 2 diabetes), type I diabetes, impaired glucose tolerance, toxin ingestion (an exendin agonist is administered to prevent stomach contents passing into the administered to subjects undergoing gastrointestinal diagnostic investigation, particularly radiological or by magnetic resonance
                                                                                                                                                                                                                                 Exendin agonist; gastric motility; gastric emptying; treatment; spasm; postprandial dumping syndrome; postprandial hyperglycaemia; type 1 diabetes; impaired glucose tolerance; toxin ingestion; obesity; Gila monster venom; exendin-4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          similarity to glucagon-like peptides (GLP). They are GLP agonists and have been suggested (US3424286) for treatment of diabetes and prevention of hyperglycaemia.

**Reducing food intake by administering exendins or their analogues - for treatment of e.g. Obesity, type II diabetes, and losulin resistance and insulin resistance.

PT claims 16, 24; Page 8; 214pp; English.

The invention relates to a new method for treating disorders that a livention relates to a new method for treating disorders, type of a lleviated by reducing food intake, in particular obesity, type of li diabetes, eating disorders, insulin resistance syndrome, elevated plasma glucoses levels, or the risk of cardiac disease. The method comprises administering an exendin or an exendin agonist. The treatment consumption as effectively as amylin or cholecystokinin but has a much longer-lasting action (still effective after 6 hours in a mouse model).

The present sequence is that of exendin-3 which is one of the preferred
peptide 1 (GLP1) and the known exendins, they are more active (effective at lower doses), more stable to degradation and metabolism and have a longer lasting effect. Truncated forms of this peptide can be made more economically than full length versions.
                                                                                                                                                                                                                                                                                 ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       29-MAR-1999 (first entry)
Exendin-3, for use in treating disorders related to food intake.
Exendin, obesity; type II diabetes; eating disorders; cardiac disease; insulin resistance syndrome; elevated plasma glucose level; agonist.
                                                                                                                                                                                                                                                                              0; Gaps

Claim 5; Columns 13-14; 17pp; English.
R80545 is Heloderma horridum exendin-3. It is an
insulinotropic peptide, and can therefore be used in the treatment of
diabetes mellitus (types I or II), and for the prevention of
hyperglycaemia. It normalises hyperglycaemia through glucose-dependent
and insulin-(in)dependent mechanisms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Heloderma horridum exendin-3.
Exendin-3; diabetes mellitus; hyperglycaemia; insulinotropic peptide.
Heloderma horridum.

                                                                                                                                                                                                      Exendin agonists, which reduce gastric motility and delay gastric emptying, can be used to treat spasm (where associated with acute diverticulities or disorders of the bilary tract or sphincter of oddi), postprandial dumping syndrome and hyperglycaemia (particularly associated with type 2 diabetes), type 1 diabetes, impaired glucose tolerance, toxin ingestion (an exendin agonist is intestines, then the stomach pumped) and obesity. They can also be administered to subjects undergoing gastrointestinal diagnostic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                WPI; 95-262627/34.
Stimulating/inhibiting insulin release with exendin polypeptide(s)
                                                                                                                                                                                                                                                                                                                                                                        investigation, particularly radiological or by magnetic resonance
                                                                                                                                                                                                                                                                                                                                                                                                                      similarity to glucagon-like peptides (GLP). They are GLP agonists and have been suggested (US5424286) for treatment of diabetes and prevention of hyperglycaemia.
                                                                                                                                                                                                                                                                                                                                                                                                           have some sequence
They are GLP agonia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ÷
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      0;

PI TRUNCATE OF VERSIONS of exendin peptide(s) for treating diabetes -

increase secretion and biosynthesis of insulin, but reduce those of

Truncated versions of exendin peptide(s) for treating diabetes -

Slucagon, and do not induce hypoglycaemia

Peptides w39303-w39420 are fragments of exendin-3 and exendin-4

isolated from Heloderma horridum which are used in a novel method

for the treatment of diabetes mellitus. These peptides can stimulate

CC qlucagon, and independent of this activity can increase peripheral

CG glucagon, and independent of this activity can increase peripheral

CG glucagon, ind independent of this activity can increase peripheral

CG glucagon, ind independent of this activity can increase peripheral

CG glucagon, ind independent of this activity can increase peripheral

CG glucagon, ind independent of this activity can increase peripheral

CG glucagon, ind independent of this activity can increase peripheral

CG glucagon, and independent of this activity can increase peripheral

CG glucagon, and independent of this activity can increase peripheral

CG glucagon, and independent of this activity can increase peripheral

CG glucagon, and independent of peripheral

CG sugar levels are high, so they will not induce hypoglycaemia. Compared

CC metabolism and have a longer lasting effect. Truncated forms of this

CG peptide can be made more economically than full length versions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Reducing food intake by administering exendins or their analogues - for treatment of e.g. obesity, type II diabetes, eating disorders and insulin resistance.

Claims 18, 26; Page 12; 214pp; English.

The invention relates to a new method for treating disorders that are alleviated by reducing food intake, in particular obesity, type II diabetes, eating disorders, insulin resistance syndrome, elevated plasma glucose levels, or the risk of cardiac disease. The method comprises administering an exendin or an exendin agonist. The treatment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               29-WAR-1999 (first entry)
Exendin-4 (1-28) amide for use in treating disorders related to food.
Exendin; obesity, type II diabetes; eating disorders; cardiac disease;
insulin resistance syndrome; elevated plasma glucose level; agonist.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

plucagon, and do not induce hypoglycaemia claim 2; Page 27; 150pp; English.

Claim 2; Page 27: 150pp; English.

Peptides wy3303 wy3420 are fragments of exendin-3 and exendin-4 isolated from Heloderma horridum which are used in a novel method for the treatment of diabetes mellitus. These peptides can stimulate biosynthesis and secretion of insulin, but have the opposite effect on glucagon, and independent of this activity can increase peripheral glucose utilisation. Exendin-3 and exendin-4 are only active when blood sugar levels are high, so they will not induce hypoglycaemia. Compared active (effective at lower doses), more stable to degradation and metabolism and have a longer lasting effect. Truncated forms of this peptide can be made more economically than full length versions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ò
                                                                                                                                                                                                                                                                               ó
                   consumption as effectively as amylin or cholecystokinin but has a much longer-lasting action (still effective after 6 hours in a mouse model). The present sequence is that of exendin-4 (1-28) amide which is one of the preferred compounds for use in the method.
                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Truncated versions of exendin peptide(s) for treating diabetes -

Contridum. This peptide and its salts, esters and derivatives can be care to treat diabetes mellitus. They stimulate biosynthesis and independent of this activity an increase peripheral glucose utilisation.

Exendin-3 and exendin-4 are only active when blood sugar levels are compared with glucagon-like Exendin-3 and exendin-4 he known exendins, they are more active (effective at lower doses), more stable to degradation and metabolism and have a connence at lower doses), more stable to degradation and metabolism and have a connence at lower doses), more stable forms of this peptide can be made more connence at lower doses.

PR (BOEF ) and this known exendins of this peptide can be made more connence at lower doses).

PR (BOEF ) and this length versions.

Reducing food intake by administering exendins or their

Reducing food intake by administering exendins or their

analogues - for treatment of e.g. obesity, type II diabetes,

eating disorders and insulin resistance

analogues 0, 24; Page 8, 214pp; English.

The invention relates to a new method for treating disorders that

are alleviated by reducing food intake, in particular obesity, type

II diabetes, eating disorders, insulin resistance syndrom, elevated

plasma glucose levels, or the risk of cardiac disease. The method

comprises administering an exendin or an exendin agonist. The treatment

reduces appetite and lowers plasma lipid levels. If inhibits food

consumption as effectively as amylin or cholecystokinin but has a much

longer-lasting action (still effective after 6 hours in a mouse model).

The present sequence is that of exendin-3 which is one of the preferred

compounds for use in the method. Exendin-3, for use in treating disorders related to food intake. Exendin; obesity; type II diabetes; eating disorders; cardiac disease; insulin resistance syndrome; elevated plasma glucose level; agonist.                                                                                                                                                                                                                                                                                                                                      Stimulating/inhibiting insulin release with exendin polypeptide(s) - for treating diabetes mellitus and preventing hyperglycaemia.

Claim 5. Columns 13-14; 17pp; English.

R80545 is Heloderma horridum exendin-3. It is an insulinotropic peptide, and can therefore be used in the treatment of diabetes mellitus (types I or II), and for the prevention of hyperglycaemia. It normalises hyperglycaemia through glucose-dependent sequence 39 AA;
                                                                     27-FEB-1996 (first entry)
Heloderma horridum exendin-3.
Exendin-3; diabetes mellitus; hyperglycaemia; insulinotropic peptide.

Regulating gastrointestinal motility using exendins or their agonists - for treating spasm, diabetic postprandial hyperglycaemia, impaired glucose tolerance etc., also in diagnostic investigations impaired glucose tolerance etc., rightsh.

W47549 describes a generic exendin agonist, provided that it does have the formula of either exendin-3 (W47608) or exendin-4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Exendin agonists, which reduce gastric motility and delay gastric emptying, can be used to treat spasm (where associated with acute diverticulities or disorders of the biliary tract or sphincter of oddi), postprandial dumping syndrome and hyperglycaemia (particularly associated with type 2 diabetes), type 1 diabetes, impaired glucose tolerance, toxin ingestion (an exendin agonist is administered to prevent stomach contents passing into the intestines, then the stomach pumped) and obesity. They can also be administered to subjects undergoing gastrointestinal diagnostic investigation, particularly radiological or by magnetic resonance
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Exendin agonist; gastric motility; gastric emptying; treatment; spasm, postprandial dumping syndrome; postprandial hyperglycaemia; type I diabetes; impaired glucose tollerance; toxin ingestion; obesity; Gila monster venom; exendin-3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Ĥ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Length 39;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              analogues - for treatment of e.g. obesity, type II diabetes, eating disorders and insulin resistance cating disorders and insulin resistance claims 17, 25, page 8: 214pp; English.

The invention relates to a new method for treating disorders that are alleviated by reducing food intake, in particular obesity, type II diabetes, eating disorders, insulin resistance syndrome, elevated plasma glucose levels, or the risk of cardiac disease. The method comprises administering an exendin or an exendin agonist. The treatment comprises appetite and lowers plasma lipid levels. If inhibits food consumption as effectively as amylin or cholecystokinin but has a much longer-lasting action (still effective after 6 hours in a mouse model). The present sequence is that of exendin-4 which is one of the preferred sequence 39 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        29-MAR-1999 (first entry)
Exendin-4, for use in treating disorders related to food intake.
Exendin: obesity: type II dlabetes: eating disorders; cardiac disease; insulin resistance syndrome; elevated plasma glucose level; agonist.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  27-FEB-1996 (first entry)

New nucleic acid encoding proexendin - used to diagnose and treat, e.g. endocrine tumours, also to treat poisoning by reptile venome term as uspectum proexendin peptide is encoded by its cDNA thich was isolated from a H. suspectum salivary gland cDNA library. The proexendin protein comprises of a novel exendin N-terminal which was isolated from a H. suspectum salivary gland cDNA library. The proexendin protein comprises of a novel exendin N-terminal peptide (ENTP) linked to the N-terminus of the exendin A peptide

The proexendin peptids to ridentify related sequences (e.g. the cannot be used to clone or identify related sequences (e.g. the cannot be used to clone or identify related sequences (e.g. the cannot great and species of gene regulatory defects associated with metabolic disease) and species homologues (e.g. for developing animal models for drug screening).

The proexendin peptide can be used to raise antibodies. Anti-proexendin antibodies are claimed to be useful for diseases and organ failure), for identifying other regulators of cell metabolism, in drug screens and for treating metabolic diseases (e.g. diabetes) and for neutralising, or detecting, reptillan venom peptides.
                                                                  Heloderma suspectum proexendin peptide.

Heloderma suspectum proexendin; exendin N-terminal peptide; ENTP;
exendin 4 peptide; exendin 3 gene; Heloderma horridum; metabolic disease;
drug screening; endocrine tumour; organ failure; cell metabolism;
Heloderma suspectum.
                                                                                                                                                                                                                                                                                                                                                                                                                                      "Dipeptidyl peptidase cleavage site"

                                                                                                                                                                                                                                                                                                       Ĥ,
                  for treating diabetes mellitus and preventing hyperglycaemia. Claim 6; Columns 13-14; 17pp; English.
R80546 is Heloderma suspectum exendin-4. It is an insulinotropic peptide, and can therefore be used in the treatment of diabetes mellitus (types I or II), and for the prevention of hyperglycaemia. It normalises hyperglycaemia through glucose-dependent and insulin-(in)dependent mechanisms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             08-AUG-1996; US-694954.

Regulating gastrointestinal motility using exendins or their agonists - for treating spasm, diabetic postprandial hyperglycaemia, impaired glucose tolerance etc., also in diagnostic investigations injained glucose tolerance etc., also in diagnostic investigations (india) 20 and 21; Fig 1: 70pp; English
W47549 describes a generic exendin agonist, provided that it does have the formula of either exendin-3 (W47608) or exendin-4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Exendin agonists, which reduce gastric motility and delay gastric emptying, can be used to treat spasm (where associated with acute diverticulitis or disorders of the buliary tract or sphincter of Oddi), postprandial dumping syndrome and hyperglycaemia (particularly associated with type 2 diabetes), type 1 diabetes, impaired glucose tolerance, toxin ingestion (an exendin agonist is administered to prevent stomach contents passing into the intestines, then the stomach pumped) and obesity. They can also be administered to subjects undergoing gastrointestinal diagnostic investigation, particularly radiological or by magnetic resonance
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Exendin agonist; gastric motility; gastric emptying; treatment; spasm, postprandial dumping syndrome; postprandial hyperglycaemia; type 1 diabetes; impaired glucose tolerance; toxin ingestion; obesity; Gila monster venom; exendin-4.
Stimulating/inhibiting insulin release with exendin polypeptide(s)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Exendins, components of Gila monster venom, have some sequence similarity to glucagon-like peptides (GLP). They are GLP agonists and have been suggested (US5424286) for treatment of diabetes and prevention of hyperglycaemia.

Sequence 39 AA:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ij

Reducing food intake by administering exendins or their
Reducing food intake by administering exendins or their
analogues - for treatment of e.g. obesity, type II diabetes,
eating disorders and insulin resistance
The invention relates to a new method for treating disorders that
The invention relates to a new method for treating disorders that
The invention relates to a new method for treating disorders that
The invention relates to a new method for treating disorders,
If diabetes, eating disorders, insulin resistance syndrome, elevated
Indiabetes, eating disorders, insulin resistance syndrome, elevated
Comprises administering an exendin or an exendin agonist. The treatment
reduces appetite and lowers plasma lipid levels. It inhibits food
consumption as effectively as amylin or cholecystokinin but has a much
longer-lasting action (still effective after 6 hours in a mouse model).
The present sequence is that of an exendin-4 variant which is one of
                                                                                                                                                                                                                                                                                                                                                                                                                                                 ij
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Fig. 95-262627/34.

Stimulating/inhibiting insulin release with exendin polypeptide(s) Stimulating/inhibiting insulin release with exendin polypeptide(s) for treating diabetes mellitus and preventing hyperglycaemia.

Claim 7: Columns 13-14: 17pp: English.

R80547 is the Heloderma suspectum exendin-4 residues 9-39. It is an insulinotropic peptide activity inhibitor.

Sequence 31 AA:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           27-FEB-1996 (first entry)
Beloderma suspectum exendin-4 residues 9-39 (Extendin-4(9-39)).
Exendin-4; residues 9-39; Exendin-4(9-39);
Insulinotropic peptides; inhibitor.

                           Stimulating/inhibiting insulin release with exendin polypeptide(s) - for treating diabetes mellitus and preventing hyperglycaemia. Claim 1; Columns 13-14; 17pp; English. R80543 is the Heloderma suspectum exendin-4 residues 1-31. It is an insulinotropic peptide, and can therefore be used in the treatment of diabetes mellitus (types I or II), and for the prevention of hyperglycaemia. It normalises hyperglycaemia through glucose-dependent and insulin-(in)dependent mechanisms.
                                                                                                                                                                                                                                                                     29-MAR-1999 (first entry)
Exendin-4 (1-30) for use in treating disorders related to food intake.
Exendin; obesity, type II diabetes; eating disorders; cardiac disease; insulin resistance syndrome; elevated plasma glucose level; agonist.
                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ŏ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This peptide is a fragment of exendin-3 isolated from Heloderma horridum. This peptide and its salts, esters and derivatives can be horridum. This peptide and its salts, esters and derivatives can be suced to treat diabetes mellitus. They stimmlate biosynthesis and secretion of insulin, but have the opposite effect on glucagon, and independent of this activity can increase peripheral glucose utilisation. Exendin-3 and exendin-4 are only active when blood sugar levels are high, so they will not induce hypolycaemia. Compared with glucagon-like peptide 1 (GLP1) and the known exendins, they are more active (effective longer lasting effect. Truncated forms of this peptide can be made more sequence 30 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Ĥ
                                                                                                                                                                                                                                WELL 95-262627/34.
Stimulating/inhibiting insulin release with exendin polypeptide(s) -
Stimulating/inhibiting insulin release with exendin polypeptide(s) -
Lor treating diabetes mellipts and preventing hyperglycaemia.
Claim 2: Columns 13-14: 17pp; English.
R80544 is the Heloderma suspectum exendin-4 residues 1-31, where
the native Pro31 has been replaced with a Tyr residue. It is an
insulinotropic peptide, and can therefore be used in the treatment of
diabetes mellitus (types I or II), and for the prevention of
hyperglycaemia. It normalises hyperglycaemia through glucose-dependent
Sequence 31 AA,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Truncated versions of exendin peptide(s) for treating diabetes -
increase secretion and biosynthesis of insulin, but reduce those of
glucagon, and do not induce hypoglycaemia
Claim 1; Page 3; 150pp; English.

glucagon, and do not induce hypoglycaemia collaim 2; page 27; 150pp; Bnglish.
Peptides w3930-W39420 are fragments of exendin-3 and exendin-4 isolated from Heloderma horidum which are used in a novel method for the treatment of diabetes mellitus. These peptides can stimulate biosynthesis and secretion of insulin, but have the opposite effect on glucagon, and independent of this activity can increase peripheral glucose utilisation. Exendin-3 and exendin-4 are only active when blood sugar levels are high, so they will not induce hypoglycaemia. Compared with glucagon-like peptide 1 (GIPI) and the known exendins, they are more active (effective at lower doses), more stable to degradation and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        metabolism and have a longer lasting effect. Truncated forms of this peptide can be made more economically than full length versions. Sequence 30 AA;

Ξ,

```
horridum. This peptide and its salts, esters and derivatives can be used to treat diabetes mallitus. They stimulate blosynthesis and insed to treat diabetes mallitus. They stimulate blosynthesis and independent of this activity can increase peripheral glucose utilisation. Exendin-3 and exendin-4 are only active when blood sugar levels are high, so they will not induce hyposylvaemia. Compared with glucagon-like peptide 1 (Girl) and the known exendins, they are more active (effective at lower doses), more stable to degradation and metabolism and have a longer lasting effect. Truncated forms of this peptide can be made more sconomically than full length versions.

Exendin-4 does not stimulate amylase secretion by pancreatic acinar
J. Biol. Chem. (1992) 267:7402-7405
Isolation and characterization of exendin-4, an exendin-3
analogue, from Heloderma suspectum venom. Further evidence
for an exendin receptor on dispersed acini from guinea pig
                                                                                                                                                                                                                                                                                                                                         Ä
